Research Interests

My current research focuses on evaluating structure-based graph neural networks for protein-ligand binding affinity prediction in the context of rational small molecule drug design. Specifically, I am interested in exploring why structure-based models underperform relative to ligand-only models, with an emphasis on physical biases such as E(3)-invariance and -equivariance. More generally, I am excited by any research that combines structural biology, physics, and machine learning.

Education

Ph.D. in Computational Biology and Medicine

July 2021 – Sept 2026

Memorial Sloan Kettering Cancer Center
and Weill Cornell Medical College, New York, NY

Advisor: John Chodera

Thesis: “Structure-Based Machine Learning in Drug Discovery: Model Construction, Data Acquisition, and Model Evaluation for Protein-Ligand Binding Affinity Models”

B.S. in Chemical and Biomolecular Engineering

Sept 2015 – May 2019

The Johns Hopkins University, Baltimore, MD

Research Experience

The Chodera Lab, Memorial Sloan Kettering Cancer Center

Jan 2022 – Sept 2026

Graduate Student

- Investigated the importance of incorporating physical biases in structure-based machine learning models for protein-ligand binding affinity prediction
- Assessed the performance, data efficiency, and generalizability of structure-based graph neural networks in the task of predicting protein-ligand binding affinities
- Developed a framework for modularly adapting arbitrary neural network architectures for structure-based machine learning
- Supported the drug discovery efforts of the AI-driven Structure-enabled Antiviral Platform through development of a computational chemistry software suite designed to assist at key stages of the drug discovery pipeline
- Conceptualized and planned appropriately scoped projects for rotation graduate students and summer undergraduate interns, and mentored these students during their time in the lab
- Implemented an alternative atom enumeration scheme in the **espaloma** molecular machine learning model

Schrödinger, Inc.

May 2025 – Aug 2025

Machine Learning Intern

- Implemented improvements to Schrödinger’s internal Target Enablement pipeline, including working with automated deployment systems and interfacing with common cofolding models

The Dobin Lab, Cold Spring Harbor Laboratory

June 2019 – June 2021

Computational Science Developer

- Developed the ConsDB Python package to evaluate functional effects of replacing the current reference genome with different consensus genomes using the 1000 Genomes Project
- Analyzed scRNA-seq and ChIP-seq data to study differential splicing and epigenetic regulation

The Karchin Lab, Institute for Computational Medicine

June 2018 – May 2019

Undergraduate Research Assistant

- Improved the MHCnuggets machine learning model for peptide-MHC binding affinity prediction by improving allele matching for rare alleles and exploring more biologically relevant features
- Evaluated the ability of the MHCnuggets pipeline to successfully predict cancer patient survival based on MHC peptide presentation

Awards and Honors

- National Science Foundation Graduate Research Fellowship Program, 2023
- Graduated from Johns Hopkins University with General Honors and Departmental Honors, 2019
- Johns Hopkins University Dean's List, Fall 2015-Spring 2016, Spring 2017-Spring 2019

Skills

Machine Learning/Deep Learning: Hyperparameter tuning, model architecture selection, pre-training, data processing, graph neural networks, PyTorch, e3nn, PyTorch Geometric, Weights & Biases, scikit-learn

Computational Chemistry: Structure visualization, molecular docking, OpenEye Toolkits, RDKit, PyMOL

Scientific Computing: High-performance computing, Git, Linux, data visualization, NumPy, Pandas, Matplotlib, Seaborn, SciPy

Programming Languages: Python, Bash, R, Rust, C++
